Veterinary Report

2019 Roedean (Kingman/Roedean) 7 mths Bay Thoroughbred Filly

Radiographs of the above foal taken on the 11th November 2019 have been examined and graded 2/4 with minor changes which are unlikely to be of future clinical significance.

These include a small area of lytic change to the mid lateral trochlear ridge of the left stifle. No significant abnormality was detected on palpation of the left stifle.

On endoscopic examination the larynx was graded 2A, with occasional, transient asymmetry but full abduction was easily achieved and maintained.

J Campbell, BVMS, MRCVS
